                                                                                   Falzon M., Chung's.Y.;
"The expression of rat homeobox-containing genes is developmentally regulated and tissue specific.",
Development 103:601-610(1989).
-!- FUNCTION: Sequence-specific transcription factor which is part care developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-!- SUBCELLUIAR LOCATION: Nuclear.
-!- TISSUE SPECIFICITY: Predominantly spinal cord and kidney.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gарв

                                                                                                                                                                                                    -I- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-!- SUBCELLULAR LOCATION: Nuclear.
-!- TISSUE SPECIFICITY: Predominantly spinal cord and kidney.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE=91238215; PubMed=1674560; Crompton M.R., McGregor A.D., Goodwin G.H.; Compton M.R., McGregor A.D., Goodwin G.H.; CDNA cloning of a homeobox-containing gene expressed in avian myeloblastic virus-transformed chicken monoblastic leukaemia cells."; Leukemia 5:357-360(1991).

"Organization of human class I homeobox genes.";

Genome 31:745-756(1989).

-!- FUNCTION: Sequence-specific transcription factor which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.

-!- SUBGUNIT: INTERACTS WITH SMADI.

-!- SUBCELIUTAR LOCATION: Nuclear.

-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                              MEDLINE-98019011; PubMed-9357979; Flagiello D., Gibaud A., Dutzillaux B., Poupon M.F., Malfoy B.; "Distinct patterns of all-trans retinoic acid dependent expression of HOXE and HOXE homeogenes in human embryonal and small-cell lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      GO; GO:0005634; C:nucleus; NAS.

                                     a developmental regulatory system that provides cells with specific positional identities on the anterior-posterior axis.
-!-SUBCELLULAR LOCATION. NOLCAET.
-!- DEVELOPMENTAL STAGE: THE HOX-2 GENES ARE EXPRESSED IN WHOLE EMBRYOS AND FETUSES AT 5-9 WEEKS FROM CONCEPTION.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Buteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      "Complementary homeo protein gradients in developing limb buds.";

Genes Dev. 3:641-650(1989).

-!- FUNCTION: Sequence-specific transcription factor which is part of
a developmental regulatory system that provides cells with
specific positional identities on the anterior-posterior axis.
-!- SUBCELLUIAR LOCATION: Nuclear.
-!- SIMILARITY: Belongs to the Antp homeobox family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Kosaki K., Kosaki R., Suzuki T., Yoshihashi H., Sasaki K., Matsuo N., "A complete mutation analysis panel of human HOX genes.", Submitted (NOV-2000) to the BMBL/GenBank/DDBJ databases.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 10, Application US/09302305C
Patent No. 6350572
Patent No. 6350572
BERERAL INFORMATION:
APPLICANT: Bernards, Rene
APPLICANT: Zwijsen, Renate
TITLE OF INVENTION: Co-Activators and Uses Thereof in Assays
FILE REFERENCE: 4238/80713
CURRENT APPLICATION NUMBER: US/09/302,305C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```
The present invention relates to a new radiotherapeutic agent precursor comprising a protein containing a targeting peptide, a phosphorylation peptide, a linker and Src homology region 2 domain (SH2). The invention is useful for preparing radiotherapeutic agents, useful for the treatment of tumour and an infectious lesion. The lesions include infectious lesion. The lesions include infectious cof tumour and an infecting chest, abdomen and pelvis and skin; and cardiovascular lesions affecting chest, abdomen and pelvis and skin; cardiovascular lesions such as myocardial infarct, atherosclerotic plaque, clot, thrombosis, pulmonary embolism, inflammatory lesions and cufficiently flexible to allow the SH2 domain to make a turn and fold back on the phosphorylated substrate. Thus, the radiotherapeutic agent sufficiently flexible to allow the SH2 domain to make a turn and fold back on the phosphorylated substrate. Thus, the radiotherapeutic agent chosphorylation, while maintaining the ready the agent. The phosphorylation, while maintaining ability of the agent. The present amino acid sequence represents a human peptide that contains an SH2 domain as described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Major histocompatibility complex; MHC; cytostatic; vaccine; immunogen; cytocoxic T lymphocyte; CTL; carcinoma; tumour; cytokine; immunotherapy; cancer; prostate; colorectal; ovarian; lung.
                                                                                                                                                                                                                                                                                                          Radioactive agent precursor, useful in manufacture of in vivo radiotherapeutic agents, comprises protein containing targeting peptide, phosphorylation peptide, linker and Src homology region 2 domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Major histocompatibility complex class II immunogenic peptide #27.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;

The invention relates to an immunogen such as a major histocompatibility complex (MHC) polypeptide over-expressed on prostate cancer cells. The immunogen comprises an oligopeptide, a peptide mimetic of the oligo nucleotide or an oligopeptide having a sequence differing by up to three conservative amino acid substitutions. The immunogen is useful for a conservative amino acid substitutions. The immunogen is useful for a prostate carcinoma. The induced CTL in vitro that is specific for a prostate carcinoma. The induced CTL is useful for treating a subjected characterised by tumour cells expressing any class I MHC molecule and a gene coding for an epitopic sequence, by administering the induced CTLs in an amount sufficient to destroy the tumour cells indirectly through the elaboration of cytokines. The immunogen is useful for through the elaboration of cytokines. The immunogen is useful for prevention, treatment and diagnosis of cancer, preferably prostate cancer, colorectal cancer, ovarian cancer or lung cancer, as diagnostic markers of cancer, as screening agents, to stimulate the production of antibodies for use in passive immunotherapy, and as reagents in processes such as affinity chromatography. The immunogen is also for development of vaccines and as therapeutic agents for stimulation of the immune system for killing prostate cancer cells. The present sequence is MHC class II immunogenic peptide derived from SHC transforming protein (p66shc)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ô

                  SHC is
Human SHC (AAW14005) is a transforming protein with an Src homology domain 2 (SH2). It is implicated in mitogenic signal transduction. SHC is capable of binding novel murine and human SHIP (SH2- containing inositol phosphatase) proteins (see also AAW14002-03). SHC, or its SH2 domain, phosphotyrosine binding recognition sequence, or region contg. Tyr-317, can be used in methods for assaying agonists and antagonists of SHIP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to modulators that affect the interaction of a polypeptide defining a PI (phosphotyrosine interaction) domain, or its conserved variants or fragments, with APP (amyloid precursor protein). The polypeptide defining a PI domain binds to the cytoplasmic domain of APP, regulating the secretion of APP fragments. By modulating this interaction, the modulator can inhibit or prevent APP processing and trafficking, and thus progress or onset of Alzheimer's disease. The
                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              mammals, particularly Alzheimer's disease and dementia. This phosphotyrosine binding domain (PTB) was identified by deletion analysis of SHC. Recombinant PTB can be obtd. by insertion of encoding DNA (see also AAT09252) into a vector and expression in host cells, pref. Escherichia coli or Sf9 insert pathways, or to screen potential PBB (ant) agonists, to determine whether a protein is a phosphorylated ligand of a PTB domain, or to block growth factor dependent stimulation of cells

The present sequence represents a p66 polypeptide. The specification describes a p66 polypeptide, where at least 1 serine residue is absent replaced by a different amino acid residue. Targeted mutations of p66 gene induce stress resistance and prolong survival. The p66 gene is involved in the process of aging and in tumour suppression. p66 is a downstream target of p53 in the execution of the p53-mediated apoptosis and cellular senescence. Manipulation of p66 can therefore be used to restore p53 function in p53 null cells. Agonists of p66 may be used as tumour suppressors. Any molecules that prevent p66 dephosphorylation or kinases that induce p66 phosphorylation are potential tumour treatment agents. Antibodies to p66 and antisense sequences to p66 are useful for preparing a medicament useful for treating lung emphysema, myocardial infarction, stroke, premature aging, cell senescence, Parkinson's disease, Alzheimer's disease, cancers and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

The present invention provides the protein and coding sequences of a number of human shear stress response proteins. These are useful in the diagnosis, treatment and screening of vascular diseases caused by arteriosclerosis, including heart failure, post-PTCA restenosis and

         The invention relates to modulators that affect the interaction of a polypeptide defining a PI (phosphotyrosine interaction) domain, or its conserved variants or fragments, with APP (amyloid precursor protein). The polypeptide defining a PI domain binds to the cytoplasmic domain or the polypeptide defining a PI domain binds to the cytoplasmic domain of the screetion of APP fragments. By modulating this interaction, the modulator can inhibit or prevent APP processing and trafficking, and thus progress or onset of Alzheimer's disease. The mandlactors are used to treat and/or prevent neurodegenerative diseases in mammals, particularly Alzheimer's disease and dementia. Sequences AX13448-461 represent examples of polypeptides defining a PI domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to analysing the activity or level of one or more proteins or enzymes, comprising providing a pool of substrates (e.g. peptides, antibodies, binding domains or other molecules which act as substrates or control substrates), each with a specific tag and representing a substrate of one or more of the proteins or enzymes, or substrates derived from these using the tagged substrates as substrates, hybridising the pool of tagged substrates to an ordered array of specific and complementary tags immobilised on a surface, where the array comprises different tags, at least some of which are control tags, each tag is localised in a predetermined region of the surface and the density
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analysis of protein or enzyme activity in samples, e.g., biopsies, comprises using a pool of tagged substrates which can then be sorted onto a solid surface array after reaction.
                                                                                                                                                                                                                                                                                                  Gaps

of different tags is greater than 100 different tags per square centimetre, and all tags in the substrates derived using the proteins or craymes are complementary to at least some of the immobilised tags, quantifying hybridisation of the substrates tagged with nucleic acids or proportional to the activity of proteins or enzymes which modify or attach to the substrates tagged with nucleic acids or proportional to the activity of proteins or enzymes which modify or attach to the substrates tagged with nucleic acids or PNAs. The method can be used for detection of post-translationally modified proteins and for identifying target proteins capable of binding to, or serving as, or angremes or molecular adapters involved in biological functions. They can be used, e.g., for analysing biopsiss from cancers and other control and immobilised substrates. They can be used to identify previously unknown proteins or new substrates. They can be used to identify of the substrate, immobilised substrates leads to increased stability of the substrates. Come the kept lyophilised until use, separate from other tagged substrates. The quality of each tagged compound can be verified at any stage. Substrates can be changed, refined or differentially labelled at any time, without the need for designing or printing a new tag array. The present sequence is a peptide derived from a human cancer related gene which is attached to a nucleic acid molecule and used in an experiment
